34

Southern District of New-York, ss:

BE IT REMEMBERED, that on the 10th day of November, in the forty-second year of the Independence of the United States of America, ROBERT DONALDSON, of the said district, hath deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, to wit:

"*Formulae Selectæ: or, a collection of prescriptions of eminent physicians, with the most celebrated patent medicines; together with a syllabic view of mineral waters and poisons. "Medici ad ea remedia semper confugient quæ certa experientia prodesse comprobaverit. Gregory."*"

IN CONFORMITY to the act of Congress of the United States, entitled "An act for the encouragement of learning, by securing the copies of maps, charts, and books, "to the authors and proprietors of such copies, during the times therein mentioned;" and also, to an act, entitled, "An act supplementary to an act, entitled, an act "for the encouragement of learning, by securing the copies of maps, charts, and "books, to the authors and proprietors of such copies, during the times therein "mentioned, and extending the benefits thereof to the arts of designing, engraving, "and etching historical and other prints."

JAMES DILL,
Clerk of the Southern District of New-York.

P R E F A C E .

LORD BACON has declared a multiplicity of remedies to be the child of ignorance. The observation is, no doubt, just; but if he had been tried by it, he would have put his own reputation at hazard; for he was as partial to polypharmacy as any of his contemporaries; who esteemed it a medical axiom, that the more complex a prescription, the more virtues it possessed; accordingly, it required some scores of simples to form a sovereign remedy. It is obvious enough to the most casual observer, that this is not the opinion of the present day: we run into the other extreme, and are inclined to say that the more simple, nay, the more single the prescription, the more efficient the medicine. Many physicians carry about them all the articles of the *Materia Medica*, which they conceive necessary to enable them to contend with every form of disease, and armed with calomel, opium, tartar emetic, and a lancet, they believe themselves qualified to combat all “the ills that frail flesh is heir to.” This generalising system of practising the profession is believed to be more convenient to the physician, than beneficial to his patient, and which the present improved state of pathology and therapeutics certainly does not warrant.

In the treatment of chronic diseases, and rebellious cases, the anxious practitioner should turn with willingness to the compositions of medicines recommended by eminent men, and to such also as have acquired a reputation, although they may have originated with empirics or nurses.

A work containing a collection of prescriptions of this kind, remains a desideratum in medicine, at least in this country. The books which contain them are not always within reach, the search is tedious, and oftentimes fruitless. In order to remove in some degree these difficulties, the compilers have made a selection of the most celebrated : the number might have been much enlarged, but they presume that they have given as many as most practitioners will require ; even of these, there are some, of which from their own knowledge they can say very little ; by giving them a place here, they do not pretend to settle their value ; the sources whence they are derived are usually indicated by their names, and the discriminating physician can readily judge of their individual merits.

The *Formulæ Selectæ* is intended to be a companion to the *Dispensatory*, and not in any way to supersede its use. A recipe may have reputation and deserved celebrity, and yet not find a place

among the officinal preparations, which should be few in number, and retrenched of every thing that could be deemed superfluous.

The physician is sometimes called to visit patients who have previously taken of some patent medicine, and, as it is proper that he should acquaint himself with the composition of these secret remedies, we have inserted such of them as are in most general use in this country.

The difficulty of obtaining the natural mineral waters is sufficient to account for their very limited use. Many of them can be easily and successfully imitated; of these we have chosen out a few, and given the methods of preparing them.

The haste in which the practitioner is required to administer relief to those who either by design or accident have taken poison, denies him time for reading, and almost for reflection. It behooves him, notwithstanding, to meet these cases with promptitude; and, in order that he may refresh his memory as to the mode of exhibiting the antidote, we have given such an abstract; as shall serve his purpose on such an occasion.

The arrangement of the preparations according to their forms, appeared least objectionable, and has been adopted. By this means they may be referred to

without the aid of an index ; but as works of this kind usually abound with them, we have thought proper to comply so far with established custom as to place one at the end of this volume.

Works on pharmacy are now usually given in the vernacular tongue ; and we have pursued this plan, except in the names of the articles composing a prescription ; these are put in the Latin language, because it was thought that it afforded a precision and permanency as a dead language, which no living and improving one can be expected to possess.

The Edinburgh nomenclature has been adopted, as being the most specific. We have departed from it in those cases only where the article was almost unknown by any other name than that given it by the London College, as, *millepedæ*, *sanguis draconis*, and a few others.

With these remarks, we submit the book to American Physicians ; if they are satisfied with the selection and arrangement, we are content ; and frankly apply to ourselves the words of Jovius : “ Castrant alios ut libros suos per se graciles alieno adipe suffarcent.”

Digest for ten days, and filter for use.

Employed as a cathartic and stomachic in Dyspepsia.

Bishoprick's Compound Vitriolic Tincture.

R. Sulph. Cupr. Calc.	3 <i>viiij.</i>
Gum. Kino	3 <i>ij.</i>
Alcohol.	○ <i>ij..M.</i>

Let the Sulphate of Copper and Gum Kino be pulverized, and added to the Alcohol. Digest in a sand bath for four days, and decant the tincture for use.

Do. *xl.* to *lx.* every four or five hours.

This is one of the most powerful remedies with which we are acquainted, in Menorrhagia, and other

passive hemorrhages. We have given the recipe as published in the Edinburgh Medical Commentaries; but it must appear obvious to the most casual observer, that the alcohol cannot dissolve all the sulphate of copper, and, also, that the heat of a sand bath will destroy the alcoholic character of the tincture.

Dos. 3*j.* to 3*iv.*

This is believed to be the last edition of the once celebrated Edinburgh Treacle. And, although it has lost its reputation both in this country and in Great Britain, as it continues to be much used on the

continent, we have given it a place ; not so much from a persuasion that it will ever redeem its reputation, as from a disposition to record an ancient prescription, and satisfy those who are curious in such matters.

Make into pills, each gr. *ijj.*

Dos. *ij.* to *iv.* twice a day.

This pill is commonly known by the name of the *Blessed Pill*, and is one of the most powerful emmenagogues in use.

Fondyee's Sarsaparilla Decoction
℞ Rad. Smil. Sarsap. ℥ij
Aq: qd — — Oij

Boil to Oij
This quantity to be drank in the
course of the day — —

Decoction: Iceland Moss.

℞ Leichen Island: (washed) ℥ij
Aq: tepid q. s.

Macerate for six hours, then
put it into Water Oij
and boil to one third; strain
and add Syrup: of Marsh Mallow. ℥ij

Diuretic Decoction

℞ Bac: Junip: (bruised). ℥ij
Aq: — — Oif.

boil half an hour and add
to the strained decoct.

Syrup: Polyg: Lenck: ℥ij

Vin: Aet:

ʒ viij Hc

Dos: ʒ if in the morning fastay

Carbonated Cinchona Decoction

R. Bark. cinchona — $\frac{3}{4}$

T. Ag. Corstan — $\frac{3}{4}xx\frac{1}{2}$

Boil to $3xvij.$ and divide
the decoction into two equal
portions; in one put of Carb. Soda
 $\frac{3}{4}$ an & into the other Sulphuric
acid diluted $\frac{3}{4}$.

Dos. $\frac{3}{4}$ fls. of each every hour the
patient taking first the decoct
with the Soda —

=

Pomegranate root decoct:

R. Rad: Punic: granat $\frac{3}{4}$ fls

Aq: — $\frac{1}{2}$ Oij

Boil for half an hour and add
to the strained decoct

Syrup: Menth $\frac{3}{4}$ fls $\frac{1}{2}$ M

Dos $3vij$ night and morning

=

FUMIGATIONS.

Acetous Fumigation.

This vapour is extricated by gradually pouring vinegar on a heated iron.

Carmichael Smyth's Fumigation.

Bz Acid. Sulphuric.

Nitr. Potass.

aa 3i.

This quantity is sufficient for an apartment twenty feet square.

The sulphuric acid is placed in a glass or china vessel, and the nitre gradually added: in order to have an abundant extrication of nitrous gas, it is necessary to raise the temperature of the sulphuric acid, by means of a lamp or sand bath.

This gas may be respired with perfect safety, and even with advantage in fevers; it should therefore, always be preferred where the sick remain in the room.

Guyton D'Morveau's Fumigation.

R. Mur. Sod.	3vij. 3iij.
Pulv. Oxyd. Manganes.	3i.
Aq. Fontan.	
Acid. Sulphur.	aa 3iv. M.

This quantity is sufficient for an apartment twenty feet square.

The ingredients are to be mixed in a glass or porcelain vessel.

The Oxymuriatic acid gas is undoubtedly the best fumigation to destroy the contagious miasmata of uninhabited apartments; but it should be extricated in very small quantities in those cases where the sick are obliged to remain in the room.

Anti-Pestilential Fumigation.

R. Sulphur. Sublim.	
Pulv. Nitr. Potass.	
— Gum. Myrrh.	aa 3i. M.

To be gradually sprinkled on burning coals. The vapour is injurious to respiration, and should be used cautiously.

Sulphuretted-Hydrogen Fumigation.

R. Sulphuret. Potass.	3 ss.
Aq. Fontan.	3 viij.
Acid. Muriatic.	3 ij. M.

The breathing of this gas has been recommended in Phthisis Pulmonalis ; it should however be used with great caution, and extricated very sparingly ; for if the air should become greatly changed with it, the effects might be fatal.

POISONS.

POISONS.

THAT branch of science which has for its object an inquiry into the nature, qualities, and effects, of deleterious substances, with a view to the successful medical treatment of poisoned persons, and the improvement of medical jurisprudence, has of late years occupied so large a share of public attention, been so much expanded, enriched, and enlightened, by the aids of a rational philosophy in the hands of able experimenters, that it might be deemed unnecessary in this place, and in this manner, to say any thing on the subject ; but as we are indebted for the greatest improvments in this science, to the labours of persons who have written in a language not in this country generally read, and as the works themselves are voluminous, we have thought proper to give a very syllabic view of a few of the poisons, tests, antidotes, and methods of treatment. We have done it from a belief that it would comport with the scope of the book, which is compiled not so much with a view to the instruction of the ignorant as to serve as an index of facts to refresh the memory of those who are informed, but whose avocations render it impossible for them to consult, on the spur of an occasion, works professedly treating of this subject. The view which we will give shall, there-

fore, be as short as possibly can consist with perspicuity ; (perhaps, in the opinion of the reader, much too short to serve that purpose;) and will include such of the poisons only as are most common, and most frequently the subject of medical treatment.

MINERAL POISONS.

ANTIMONY.

The preparations of this metal can scarcely be considered as poisonous at this day, although the time has been when it was thought expedient to prohibit its use in medicine by royal edict.

Its use is so extensive, and its effects are so well understood, that little danger can be apprehended except from the accidental exhibition of an extraordinary quantity; and even in this case, the invariable emetic tendency of all its preparations generally secures the system against the lesions usually consequent upon the ingestion of metallic corrosive poisons. Emetic tartar is the preparation of this metal most usually employed in medicine.

It is detected, when in solution, by the following marks :

Vegetable blues are changed by it to a red colour.

With the hydrosulphurets, it deposits a yellow precipitate.

With the tincture of galls, it deposits a cream coloured precipitate; and,

With the sulphuric and nitric acids, and lime water, it produces a white precipitate.

Taken into the stomach, it produces an inverted action of that organ, and is so soon expelled, that it is almost superfluous to attempt its decomposition. If at any time medicines with this view are admissible, they are alkalies and bark infusions. The chief dependence will be found to be in the exhibition of large and frequently repeated draughts of tepid water, in mild expressed vegetable oils, milk, and vegetable astringent infusions.

ARSENIC.

This metal, in all its forms and combinations, is a most destructive poison. The white oxyd, being the preparation most generally known, and from that cause, perhaps, most frequently used for the destruction of human life, is the poison, to which, what follows more immediately refers. All that may be said of it will apply with equal propriety to its other preparations.

Its form is that of white opaque masses externally, apparently semivitrified, and transparent within; its taste is acrid and corrosive; its specific gravity 5.000. When burnt, it volatilizes in very dense white vapours, with the odour of garlick.

A solution of it mixed with a solution of vegeta-

ble alkali, and heated with the sulphate of copper, will cause a deposit of a beautiful green colour.

An alkaline sulphuret will precipitate it from any of its solutions, and this deposit may be submitted to the tests of heated copper, or heated iron.

The Ammoniaco-nitrate of silver is said to be capable of detecting the most minute quantity in solution, with which it presents a beautiful yellow precipitate.

The science of chymistry has yet to discover an antidote to the poison of arsenic. Therefore, the attention of the physician should be immediately directed to its expulsion from the system, by means of vegetable emetics, combined with large and repeated doses of tepid water, decoctions of linseed, marshmallows, milk, solutions of the albumen of eggs, or oily and emollient ptisans ; prescribing, as the urgency of the case requires, those medicines which are calculated to relieve or arrest inflammation of the stomach and intestines, which the ingestion of this poison invariably produces.

MERCURY.

All the preparations of this metal are poisonous, differing only in degree. The most active one is the oxymuriate, which is of very general use in medicine, both externally and internally.

It is a beautiful white semi-transparent ponderous salt, whose taste is extremely acrid, styptic, and permanent; and is readily detected in solution by the following tests:

It changes to a green the vegetable blues.

It is precipitated from its solutions by the caustic alkalies in the form of an orange coloured powder, which gradually changes to a red.

It is precipitated by the carbonates of soda and potass, in the form of a powder permanently yellow.

This salt treated with potass in a glass tube by heat, is converted into metallic mercury.

As this is one of the most violent poisons with which we are acquainted, and has been frequently taken with the intention of committing suicide, eminent chymists have been engaged in experiments, which should lead to the discovery of an antidote. It is known to be easily decomposed, and, therefore, it was formerly believed that its effects could be suspended or moderated by most of the substances capable of producing its decomposition. But as all the combinations of mercury with acids, with the exception of the *submuriate*, are very poisonous, its decomposition merely changes the character of the deleterious agent, without controlling its operation, or, at least, without affecting it in any material degree.

The alkaline salts, and earths, the carbonate of potass, and the sulphurets of potass and lime, all ca-

pable of decomposing it, have been found utterly insufficient to neutralize its poison ; and it is not long since, from the experiments of M. Orfila, that we were warranted in saying, that we had any substance which could claim the character of an antidote. His experiments are very conclusive in favour of Albumen ; that it is not only antidotal, but the *only* substance useful in cases of poisoning by this murderous agent.

The treatment of patients is to be commenced by large and repeated draughts of the albumen of eggs, mixed, or suspended in water, with the triple view of neutralizing, diluting, and evacuating the poison. If the patient cannot swallow, it is to be introduced into the stomach by means of an elastic flexible tube. Enemas of the same description, or of the decoctions of linseed, mallows, or other mild viscid vegetables, are to be frequently exhibited, treating the patient according to the rules of art, when the poison is believed to be completely evacuated.

SILVER.

The nitrate of silver is the *only* preparation of this metal, whose internal use is admissible in medicine. It is a very corrosive poison ; and externally applied,

it is one of the most instantaneous escharotics with which we are acquainted. It is a salt easily soluble, and readily decomposed. Intentional poisonings by it very rarely occur; accidental ones oftener.

Potass, soda, and lime, will precipitate it from its solution in the form of a very brown powder; and ignited charcoal will so completely decompose it, when brought in simple contact, as to reduce it to its metallic state.

From the facility of its solution, it may, in most cases, (if the treatment be quickly entered upon,) be eliminated from the system, by large and frequently repeated draughts of tepid water. From late experiments, it is believed to be neutralized by muriate of soda; this salt, therefore, has the highest claim to the character of its antidote. The writer of this article was accidentally called to visit a patient, (a lady aged eighteen years,) who was poisoned by lunar caustic, which had been taken by mistake, supposing it to be an opium pill. The quantity received into the stomach, as near as could be ascertained, was ten or twelve grains; its effects, very soon after taking, were apparent from the vomiting of a dark yellowish matter, which left on the bed cloaths a stain similar to that made by inde-
lible marking ink; it blackened the cuticle of the lips and hands, and inflamed the mouth and fauces, to such extent, as to produce a sloughing of the cu-

ticle lining them two or three days afterwards. The pain in the stomach was intense, and the vomiting incessant. Nothing was done for the patient, except that the vomiting was kept up with little intermission for eight hours, by means of large and repeated draughts of tepid chamomile tea. She recovered with ordinary nursing.

COPPER.

All the preparations of this metal are poisonous, although their uses in medicine, both as external and internal remedies, have proved them to be very valuable; used internally, they require much caution in their exhibition.

The tests of the presence of Copper are the following:

Copper in solution, offers a brown precipitate with the prusiate of potass; a blue one with Ammonia; and a dark brown with the hydrosulphurets.

It will also coat phosphorus and iron with metallic copper, when immersed in it.

When precipitated from its solution, it can be brought back to the state of metal by calcination with charcoal; this observation will apply to the precipitates of all the metallic salts.

There are at present no known substances which can claim the character of antidotes to this poison. Recent experiments have proved that sugar, the prussiate of potass, and prusiate of iron, can decompose it, but they require a much higher temperature than that of the human body to favour their action. Albumen alone has stood the test of experiment, and, without doubt, is the most efficient counter agent at present known.

The treatment, therefore, will principally consist in the exhibition of such substances as will favour its expulsion ; and as most of the poisons of this metal are readily soluble, the most proper emetics are those which are, strictly speaking, diluents, and operate as emetics by their quantity. The albumen of eggs suspended in warm sugar and water, given in large doses frequently repeated, is perhaps the best remedy.

After the poison is believed to be evacuated, the patient's case is properly referable to treatment strictly medical.

LEAD.

The preparations of this metal, although poisonous, are not so much to be dreaded, because not so active as many other metallic oxyds. Poisonings by

them are on this account never intentional, but frequently accidental; and they are attended with symptoms in many cases peculiar to themselves. In the late classification of M. Orfila they are called astringent, rather than corrosive poisons.

The only preparation used in medicine, as an internal remedy, is the *acetate*. It is detected in solution very easily, by the hydrosulphuret of potass, which forms with it a brown precipitate, and heated with ignited charcoal, gives back the lead in its metallic form. It is also precipitated from its solution by all the alkaline salts.

From the fact that the sulphate of lead may be received into the stomach in large doses without inconvenience, and also that epsom salt, forms with it an insoluble sulphate, it is fairly inferred, that sulph. magnes. is its true antidote ; accordingly, it is the basis of all the treatment of poisoning by it, practised in the hospitals of Paris.

NITRIC, SULPHURIC, AND MURIATIC ACIDS.

These corrosive acids are all most fearful and destructive poisons ; and incredible as it may appear, they have not unfrequently been intentionally taken to destroy life, although accidental poisonings by them are much the most frequent. We have not

thought proper to give in this place, the different tests, by which they may be distinguished, or even to describe their characters, for these obvious reasons: 1. They are too generally known to require description; and, 2. If they were not, the decision of their characters by submitting them to experiment would require more time, and occasion more delay, than could in any one case properly consist with the safety of patients, who are so unfortunate as to be the subjects of their most murderous operation. Destructive as they undoubtedly are, the cases of poisoning by them are more within the reach of remedy than those of *arsenic*, if early recourse be had to the antidotes: but the relief must come speedily, because hope is not long deferred.

The symptoms of poisoning by these acids are very similar: excessive vomitings, convulsive agitations of the face, (the evidences of the agonizing pain which the patient suffers, from the erosion of parts to which the liquid has been applied,) a heat as of burning coals in the mouth, throat, oesophagus, and stomach, a deathlike coldness of the extremities, a small irregular and intermitting pulse, difficulty of respiration, and an expression of absolute despair, mark the devastating progress of awful disease. As their symptoms are similar, so their treatment does not differ; what is applicable to one case, is alike proper for all. It consists in evacuating the offensive substance, by such means as will dilute, vomit, and neutralize;

such are the alkalies and absorbent earths, either carbonated or calcined, diffused in a great quantity of water, or of oil in the form of soaps. As there can be but little time allowed for the selection of the remedy, that which it most convenient, is undoubtedly the best. After the poison is expelled, the patient will have to contend with inflammation of the mouth, throat, œsophagus, and stomach, to such a fearful extent, as will put in requisition all the art of the most experienced practitioner.

VEGETABLE POISONS.

OPIUM.

Both intentional and accidental poisonings occur more frequently from the use of this article than any other in the *materia medica*. Infants, indeed, are so sensible to its noxious powers, that even regular practitioners have committed fatal mistakes in exhibiting it to them. The writer of this article knew a case attended with very serious symptoms, where an infant, aged seven months, had taken only two drops. Four grains of opium have been known to prove fatal to healthy adults, but the majority of persons would require more than double that quantity to produce that effect. If the amount taken be very considerable, the dangerous symptoms appear almost immediately ; but if it be more moderate, they come on from half an hour to an hour after its ingestion.

Symptoms.—Cephalgy, drowsiness, succeeded by coma ; respiration anxious, short, and interrupted ; pulse small, slow, and scarcely perceptible ; the whole body covered with a sweat cold and clammy ; visage cadaverous ; eyes half closed, and hag-

gard, with the balls immoveably fixed upwards ; pupils contracted ; distortion of the mouth with aphony, and occasional vomiting. Toward the close of the scene, the whole system is agitated with convulsions, and the respiration becomes rattling. Death usually terminates the sufferings of the patient from four to twelve hours, seldom as late as the twenty-fourth from the commencement.

Treatment.—The patient is to be made to vomit freely as soon as possible, and the vomiting is to be repeated from time to time, till his coma has disappeared. Ipecacuanha is the best emetic for this purpose, as, independent of its emetic power, it is believed to possess qualities capable of counteracting the noxious effects of opium. After the patient has vomited sufficiently, he is to drink largely of some diluted vegetable acid, as vinegar or lime juice ; he is to be exposed freely to the cool air, and to have sinapisms applied to the wrists, ankles, and scrofula cordis : flagellation is also a powerful means of arousing him from his lethargy. The French at present are in the habit of doing the same thing, by sprinkling hot water on different parts of the body. Where the power of deglutition is lost, we may often advantageously have recourse to acrid, stimulating, and purgative glysters, repeated every half hour or hour, until relief be obtained.

After the operation of the opium, the system is left

suffering under great exhaustion and indirect debility, which will require the frequent and cautious exhibition of wine, or some other diffusible stimulus, in small quantities.

It appears to be the opinion of late physiologists that opium proves fatal, by being absorbed and transmitted to the brain and nervous system, which doctrine teaches us to persevere in the use of emetics as long as we have the least suspicion that any opium may remain in the stomach. Alibert relates the dissection of a person who died from the effects of it, where he found that drug in the stomach, although the quantity taken had not been great, and the person survived its ingestion for more than twenty-four hours.

ACONITUM NEOMONTANUM,
CONIUM MACULATUM,
CICUTA VIROSA,
ÆTHUSA CYNAPIUM,

The Root.
The Herb.
The Herb.
The Herb.

The noxious qualities of these plants are so similar, and their effects on the human system so analogous, that they may be treated under the same head.

Symptoms.—Vertigo, dimness of vision, dilatation of the pupils, difficulty of utterance, praecordial anxiety, nausea, violent retchings, remarkable prostration of all the forces, cadaverous countenance,

paralysis of the extremities, pain and tumefaction of the abdomen, stupor and death.

Treatment.—In the first instance, the patient is to be made to throw off the narcotic, by the exhibition of a moderate quantity of Ipecacuanha, assisted by diluent and oleaginous drinks. And after the stomach has been well evacuated, the remainder of the poison, and its effects, are to be counteracted by the free use of diluted lime juice or vinegar.

In the last stage, the exhibition of stimulants, and anti-spasmodics, are required to combat the debility, paralysis, and stupor, the necessary result of the combined operation of the disease and previous remedies.

ATROPA BELLADONA,

The Herb.

DATURA STRAMONIUM,

The Herb and Seed.

HYOSCIAMUS NIGER,

The whole Plant.

Symptoms of poisoning by the above plants are the following :

Vertigo, dimness of vision, face pale, eyes haggard, pupils dilated, pulse small and slow, sweats cold and partial, attended with anxiety, tremors, and great prostration. This state is soon succeeded by an opposite condition of the system ; the pulse becomes

hard and frequent, the face suffused, eyes animated and sparkling, high delirium, loquacity, singing, dancing, occasional crying, accompanied with various ridiculous gestures, and alternated with tremors and convulsions.

If the symptoms still proceed, the praecordial anxiety increases, the patient makes frequent and violent efforts to vomit, the convulsions become more severe and constant, the eyes fixed and haggard, the pupils are very much dilated, and toward the close of the scene, tetanic symptoms supervene, attended by blindness and deep coma, which is soon followed by death.

Treatment.—Gentle emetics of ipecacuanha, aided by diluents, until the stomach is well evacuated ; after which, acid and mucilaginous drinks are to be given freely, together with stimulating glysters.

In the third stage our chief dependance is on aromatics, stimulants, and antispasmodics, to be employed both externally and internally.

DIGITALIS PURPUREA.—*The Leaves.*

Although we do not know any cases of poisoning by this plant terminating fatally, yet from its power of producing death in animals, and from the symptoms which attend its injudicious exhibition when used as a medicine, we do not doubt its claim to the character of a poison.

Symptoms.—Vertigo, anxiety, syncope, nausea, vomiting, purging, cold sweats, a small, irregular, and scarcely perceptible pulse, delirium, hiccough, gastrodynia, convulsions, tumefaction of the abdomen, and finally, death.

Treatment.—The vomiting is to be assisted by the exhibition of oleaginous diluents, or even a moderate dose of ipecacuanha; in like manner, also, the purging is to be encouraged by the use of an enema which shall be both purgative and stimulating.

The urgency of the symptoms, and the rapidity with which they succeed each other, render it necessary to have early recourse to the use of aromatics, stimulants, and blisters. Small and frequently repeated doses of opium, have been highly extolled as an antidote, and should be given immediately after the patient has been sufficiently evacuated.

The following are the full doses of
tincture of opium for children
in convulsions or laboring under
any other severe malady requir-
ing its administration.

Six months age -	Tinct Opium	v.
Six Mo. to twelve — — —	m, v	v
One year to two — — —	m, vii & viii	vii
Two — to three — — —	m, ix & x	x
Five years — — —	m, xii & xv	xv

Page 4 - 32 pages

La poudre métallique de M.
Gadet de Gaffricourt pour adoucir
le tranchant des instruments de chi-
rurgie. de Nouv. Tosc. Tome vij Avril.

Schiste cotécule de Namur
(pierres à raser) 34

Schiste ardoise d'Angers.

Emery des lapidaires à à 34

On met ces substances en poudres
très fines; on les corpose avec une
suffisante quantité d'onge,
jusqu'à constance de pommeau;
on étende un peu de cette pom-
meau sur le cuir à raser.

Une formule par M. Mérimée
Sulfate de fer.

Cet ingrédient décrète qu'à
on les mélange dans un mortier
et on les fait chauffer au rouge-
cierge dans un creuset. On
verse sur la matière refroidie une
suffisante quantité d'eau pour
la laver; l'eau dissout le sulf.
de soude formé, et l'on trouve
au fond du vase une poudre grise

nicacée, dorée ou torréfiée et
cepançant après être devenue pourrue
par le frottement sur le fer et
sur l'acier poli. On peut étendre
cette poudre sur un cuir à rasoir,
soit en graissant friablement ce
cuir avec un peu d'huile, soit
en l'imprégnant d'un peu
d'eau. — Note. Tour. tom. vij Avril

Bancroft's Ink

R. Aleppo galls coining powder $\frac{3}{4}$ lb.
Logwood chipped — $\frac{3}{4}$ lb.
Water — $8\frac{1}{2}$ fl. oz.
boil for two hours, strain while
hot, and add to the decoction
as much boiling water as to
make it one gallon, add of
Sulph. of iron and G. Arabic
each $\frac{3}{4}$ lb. and of Muscovado
sugar $\frac{3}{4}$ lb.

Recipe for Ink.

Infuse in a wine quart of rain or river water 2 or 4 troy of bruised gall, letting them stand in the sun four hours in summer and 6 in winter. This infusion may be used immediately after straining; but it is better to let it stand 4 or 6 months, removing the mother that forms on the top now and then and finally separating by filtration both this and the tannin that has fallen to the bottom. In this infusion an ounce troy of powdered gum arabic, then add the same weight of finely powdered sulph. of iron, impregnated by calcining it till it grows reddish, and continue shaking the mixture till this is completely dissolved. The ink thus made is fine, light and of a purple tinge, but black when dried on paper. It is nearly if not precisely, the composition of Guyot's Ink.

Blanchard's method of
preserving anatomical prepara-
tations.
